

Overview

The simplest form of solar air conditioning is a small solar panel that generates enough electricity to run a fan—for example, to cool an attic. More advanced and powerful systems use air conditioners that run just like any window air conditioner—by transferring heat from one place to another using.

A small solar-powered air conditioner can work well to keep an attic cool and dry. The unit sits on a shingle roof, just as an attic vent might. These small systems can be purchased (and easily).

Installing a larger solar air conditioning system can be costly, depending on labor and permitting costs in your area. It may be more cost-effective to install enough solar panels to run your.

Modern solar air conditioning is a relatively recent technology, so the terminology can be confusing and subject to change. Even the very term “solar air conditioning” can mean different things to.

Photovoltaic (PV) modules are very powerful, and are capable of running A/C units, delivering enough power to cool rooms for several hours using solar power.

Solar panels collect energy from the sun. They convert this energy into power. That power either goes directly to the air conditioner or to a battery where it's stored until the AC needs it.

Air conditioners use a lot of energy to remove heat from your home. The solar panels appropriately installed in direct sunlight will produce the solar energy required to run your AC unit.
