An Energy Storage New Energy

Overview

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Is battery energy storage a new phenomenon?

Against the backdrop of swift and significant cost reductions, the use of battery energy storage in power systems is increasing. Not that energy storage is a new phenomenon: pumped hydro-storage has seen widespread deployment for decades. There is, however, no doubt we are entering a new phase full of potential and opportunities.

Why do we need energy storage?

Low-cost renewable electricity is spreading and there is a growing urgency to boost power system resilience and enhance digitalization. This requires stockpiling renewable energy on a massive scale, notably in developing countries, which makes energy storage fundamental.

Should energy storage systems be mainstreamed in the developing world?

Making energy storage systems mainstream in the developing world will be a game changer. Deploying battery energy storage systems will provide more comprehensive access to electricity while enabling much greater use of renewable energy, ultimately helping the world meet its Net Zero decarbonization targets.

Should energy storage be co-optimized?

Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more

flexible. Goals that aim for zero emissions are more complex and expensive than net-zero goals that use negative emissions technologies to achieve a reduction of 100%.

Can a power plant be converted to energy storage?

The report advocates for federal requirements for demonstration projects that share information with other U.S. entities. The report says many existing power plants that are being shut down can be converted to useful energy storage facilities by replacing their fossil fuel boilers with thermal storage and new steam generators.
