Solar power uses the energy of the Sun to generate electricity. In this article you can learn about: How the Sun's energy gets to us; How solar cells and solar panels workHow does solar power work?

The sun—that power plant in the sky—bathes Earth in ample energy to fulfill all the world's power needs many times over. It doesn't give off carbon dioxide emissions. It won't run out. And it's free. So how on Earth can people turn this bounty of sunbeams into useful electricity?

Can solar panels generate electricity?

Yes, it can - solar power only requires some level of daylight in order to

harness the sun's energy. That said, the rate at which solar panels generate electricity does vary depending on the amount of direct sunlight and the quality, size, number and location of panels in use.

Do solar panels generate electricity at night?

Solar panels generate no electricity at night time. Solar panels can't store energy, so you have to use the electricity they generate when the sun is shining. You need batteries to store the energy generated. These are expensive. - Solar cells convert the light from the sun into electricity.

How do solar cells produce electricity?

Solar cells convert the light from the sun into electricity. Many solar cells can be put together to make a solar panel. Solar cells are made from a material called silicon. - Solar panels are used to produce electricity. They can be found on buildings but can also be used on a solar farm to harvest the power of the sun.

How do solar farms work?

Solar farms are large areas of land that can be covered with thousands of solar panels that generate lots of electricity. Some solar farms have fixed solar panels that always face the same direction. Some have moving panels that turn so that they always directly face the Sun. This helps them generate as much electricity as possible.

How does a solar cell work?

Each solar cell is made of multiple layers. The top semiconductor is a negative layer, which means the material contains extra electrons. The sun's energy "shakes" these electrons loose, and these electrons become naturally attracted to the bottom semiconductor layer, which is positively charged.
