Overview

What are the performance guarantees for the Bess?

The primary performance guarantees for the BESS include: roundtrip efficiency (%) - the ratio of discharging energy to charging energy, expressed as a percentage and typically assessed annually as part of the periodic testing requirements.

Why do we need a Bess system?

Deploying BESS can help defer or circum-vent the need for new grid investments by meeting peak demand with energy stored from lower-demand periods, thereby reducing congestion and improving overall transmission and distribution asset utilization.

Can a Bess provide multiple services?

Given the relatively recent and limited deployment of BESS, many stakeholders may also be unaware of the full capabilities of storage, including the ability of a BESS to provide multiple services at both the distribution and transmission level.

How does a Bess market work?

In a wholesale energy market, the BESS operator submits a bid for a specific service, such as operating reserves, to the market operator, who then arranges the valid bids in a least-cost fashion and selects as many bids as necessary to meet the system's demands.

What services can be provided by Bess?

Appropriately sized BESS can also provide longer-duration services, such as load-following and ramping services, to ensure supply meets demand. Transmission and Distribution Upgrade Deferrals: The electricity grid's transmission and distribution infrastructure must be sized to meet peak demand, which may only occur over a few hours of the year.

What if a project has a 25 MW Bess?

For example, a project with a 25 MW, 4 hour BESS providing for 300 annual equivalent cycles, would allow for the off-taker to direct dispatch of the project up 300,000 MWh ($25 \text{ MW} \times 4 \text{ hours} \times 300$) of cumulative discharged energy, as measured at the POD.

Improve the safety, availability & performance of energy

BESS availability is just as important for owners and operators who are not providing grid services but are engaging in energy trading. To take advantage of price -demand, the energy storage system must be reliable. It must be available when required and perform to its optimal potential, otherwise trades could be interrupted or rendered unviable.

This report describes good practices for BESS warranty design including: tailoring BESS warranties to applications in developing countries (offering flexibility of operation); making terms and conditions of BESS warranties clear and easy to implement (clearly define realistic environmental and operational limits that can void the warranty under

The Dirty Secret About the Booming Industry: Energy Storage Availability

It is difficult to proactively manage BESS and optimize availability without a software solution that delivers real-time insights. Without analytical software to bolster their energy management system (EMS), many BESS operators can identify that they have a problem but struggle to pinpoint the root cause.

Grid-Scale Battery Storage

Utility-scale BESS can be deployed in several locations, including: 1) in the transmission network; 2) in the distribution network near load centers; or 3) co-located with VRE generators. The siting of the BESS has important implications for the services the system can best provide, and the most appropriate location for the BESS will depend on its
