

## European Solar and Energy Storage Solutions

# Billions cubic meters of wind and solar power generation

## Overview

---

In this report, we standardize all units to QBtu. For fuel-specific data, outlooks use million barrels per day (mbd) or million barrels of oil equivalent per day (mboed) for liquid fuels, billion cubic meters (bcm) or trillion cubic feet (tcf) for natural gas, and million tonnes of coal-equivalent (mtce) or short tons for coal.

In this report, we standardize all units to QBtu. For fuel-specific data, outlooks use million barrels per day (mbd) or million barrels of oil equivalent per day (mboed) for liquid fuels, billion cubic meters (bcm) or trillion cubic feet (tcf) for natural gas, and million tonnes of coal-equivalent (mtce) or short tons for coal.

More than 500 gigawatts (GW) of renewables generation capacity are set to be added in 2023 – a new record. More than USD 1 billion a day is being spent on solar deployment. Manufacturing capacity for key components of a clean energy system, including solar PV modules and EV batteries, is expanding fast.

But an unprecedented surge in new liquefied natural gas (LNG) projects coming online from 2025 is set to add more than 250 billion cubic metres per year of new capacity by 2030, equivalent to around 45% of today's total global LNG supply.

In 2023, an estimated 96% of newly installed, utility-scale solar PV and onshore wind capacity had lower generation costs than new coal and natural gas plants. In addition, three-quarters of new wind and solar PV plants offered cheaper power than existing fossil fuel facilities.

In the charts shown here, we look at the breakdown of renewable technologies by their components – hydropower, solar, wind, and others. The first chart shows this as a stacked area chart, which allows us to more readily see the breakdown of the renewable mix and the relative contribution of each. Will solar and wind energy lead the growth in US power generation?

Solar and wind energy will lead the growth in U.S. power generation for at

least the next two years, according to EIA estimates. This report uses data from the EIA to analyze solar and wind capacity and generation over the past decade (2014 to 2023) in all 50 states and the District of Columbia.

How much energy does wind & solar produce a year?

In combination, wind and solar now contribute 37EJ to the global energy system, up 15% year-on-year. Their combined output has grown at an average 17% per year for the past decade, taking them from a total of just 8EJ in 2013 to the 2023 figure of 37EJ.

How much energy does wind and solar produce in 2023?

Wind and solar generation has grown from a combined 774TWh in 2013 to nearly 4,000TWh in 2023 – more than quintupling in a decade. Together, wind and solar accounted for 13% of global electricity supplies in 2023, up from 3% a decade earlier.

How many GW of solar power will be added in 2023?

More than 500 gigawatts (GW) of renewables generation capacity are set to be added in 2023 – a new record. More than USD 1 billion a day is being spent on solar deployment. Manufacturing capacity for key components of a clean energy system, including solar PV modules and EV batteries, is expanding fast.

Where do solar and wind power data come from?

All national and state-level data come from the U.S. Energy Information Administration (EIA). Utility-scale solar and wind summer capacity values for 2014-2022 are as reported in EIA's Historical State Data for each year.

Will solar and wind make up the majority of electricity capacity?

Projected solar and wind proportion of electricity capacity under current (optimistic) policy scenarios. Solar and wind (combined) are expected to make up a majority of electricity capacity in most U.S. states by 2035 under optimistic current policy scenarios.

## Billion cubic meters of wind and solar power generation

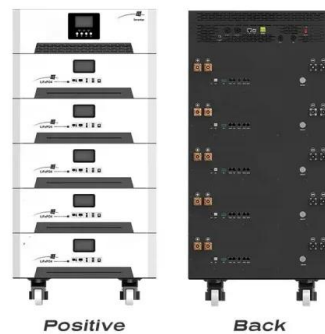

### Financial Function on Sustainable Development of China

around 25%, to increase the forest stock volume by 6 billion cubic meters from the 2005 level, and to bring its total installed capacity of wind and solar power to over 1.2 billion kilowatts by ...

### Executive summary - World Energy Outlook 2023 - Analysis

More than 500 gigawatts (GW) of renewables generation capacity are set to be added in 2023 - a new record. More than USD 1 billion a day is being spent on solar deployment. Manufacturing ...

### The solar PV market in China reaches a tipping point in ...

Increase the forest stock volume by 6 billion cubic meters from the 2005 level; Increase wind and solar power generation capacity to at least 1,200 GW. As part of this announcement, the Chinese Government stated for ...

### Global Energy Outlook 2023: Sowing the Seeds of an Energy

...

In this report, we standardize all units to QBtu. For fuel-specific data, outlooks use million barrels per day (mbd) or million barrels of oil equivalent per day (mboed) for liquid ...

## A Comparison of Energy Densities of Prevalent Energy Sources in Units

How much solar power per cubic meter is. generation rate was only a fraction of a horse power, a billion times more energy-dense than wind and water power, and a ...

## Three Gorges Crosses 100b kWh Power Generation ...

The total inflow volume to the Three Gorges Reservoir in 2021 amounted to 453.638 billion cubic meters. During the dry season, the project served the role of a fresh water resource and replenished over 22.1 billion ...

## Ethiopia renewable energy potentials and current state

With this potential Ethiopia is usually referred as the power house of Africa. However, the country has utilized less than 10% of its potential so far [17]. The country's annual surface runoff is ...

## GE Offshore Wind to Post \$1 Billion in Losses // Wind ...

"Naftogaz, the Ukrainian state-owned oil and gas firm, is making 10 billion cubic meters (bcm) of natural gas storage available to Europe 'right now', the company's CEO told EURACTIV," reports Euractiv. "In ...
