In a solar economy, one could boil water with an electric heater powered by a photovoltaic cell. But it would be far more efficient to use solar energy to heat the water directly. Can solar power boil water?

Recent developments have made it possible to use solar power to boil water. Most new buildings already use this grassroots technology to produce hot drinking water. Some even induce it directly into the water buffer by using a single- or three-phase heating element.

Can We boil water using the Sun?

To boil water using the Sun, we typically burn fossil fuels carrying several-hundred-million-year-old solar energy that was extracted from underground at great expense. It’s kind of Rube-Goldbergian. We’re fortunate that the Sun’s heat isn’t strong enough to boil the oceans (or us), but extracting the Sun’s energy at a significant scale is tricky.

How does a solar power plant work?

And to do that, they’ve got to bring water to a boil and beyond. Boiling water is big business: Coal, natural gas and concentrating solar power plants all work by turning water into steam, and using that steam to generate electricity. “Engineers have been working on making that process more efficient for well over 100 years,” Williams said.

Does a solar kettle boil water?

Like every other solar-powered device, a solar kettle captures sunlight and converts it into heat. But in this case, it boils your water. Many solar kettles are equipped with a thermometer that allows you to monitor the heating process. However, touching the body of these devices won't harm you because they remain cold even while functioning!.

How does a solar-powered steam generator work?

In 2014, Chen's group reported the first demonstration of a simple, solar-driven steam generator, in the form of a graphite-covered carbon foam that floats on water. This structure absorbs and localizes the sun's heat to the water's surface (the heat would otherwise penetrate down through the water).

Why is boiling water important?

A cup of tea is nice, but boiling water has a much bigger role: It's the main way we generate electricity. Power plants - nuclear, coal, natural gas, petroleum, concentrating solar - all rely on steam to generate electricity. And to do that, they've got to bring water to a boil and beyond.
