What is a Dali system?

In its simplest form, a DALI system consists merely of ballasts and a controller. However, the flexibility of DALI makes it readily adaptable for integration with a Building Management System (BMS). The DALI control unit or gateway acts as the master for local communications to and from ballasts.

Does zencontrol have a Dali power supply?

zencontrol’s Room controller and Lighting Control Module, all come with an internal DALI line power supply. The next requirement for a DALI system is to install a DALI device to be controlled. DALI devices are available to control almost every light source or even blind controllers or relays.

How does a Dali light system work?

DALI Sensors: DALI sensors detect motion, light levels, or occupancy and send signals to the DALI controller to adjust the lighting levels accordingly. They help reduce energy consumption by automatically dimming or turning off lights when unnecessary. **DALI Switches:** DALI switches are devices that manually control the lighting system.

What is the wiring configuration for Dali?

The wiring configuration for DALI is a simple two-wire topology, with the DALI control devices connected in parallel to the DALI control gear. The two wires, which can be polarity, carry both the power supply and the signal for the DALI network.
