# Data center generator exhaust shaft

## Overview

---

How does a single shaft generator work?

To start-up a single shaft design, the generator acts as a motor turning the turbo-compressor shaft until sufficient rpm is reached to start the combustor. If the system is operating independent of the grid (black starting), a power storage unit (typically a battery) is used to power the generator for start-up.

Are natural gas engine generators a consideration for a data center?

Read the full White Paper 286: Applying Natural Gas Engine Generators to Hyperscale Data Centers, to understand how natural gas engine generators could be a consideration for your data center. Data center design and operation impact a facilities' environmental footprint in power utilization and on-site power generation.

Can natural gas engine generators be used in hyperscale data centres?

Research teams from both Wärtsilä and Schneider Electric co-authored White Paper 286: Applying Natural Gas Engine Generators to Hyperscale Data Centers which discusses how gas engine power plants can be practically integrated into the design of hyperscale data centres, and what the implications of this may be.

How do I choose a backup generator for my data center?

To select the correct backup generator for your mission-critical data, learn the fuel, cost and efficiency considerations you should take into account. Generators can act as your only lifeline if power fails, so consider your options to ensure your data center's generator meets both your initial and future needs.

Are medium-speed gas engines suitable for large data centers?

Given the typical output of medium-speed gas engines (approximately 4. 12 MWe), they are well suited for larger data centers requiring 10 MWe or

preferably more of continuous load. Why then hasn't such a technology been applied earlier?

.

What additional cost data center options are available?

Common additional cost data center options include enhanced high ambient cooling systems, 80-degree rise alternators, low nitrous oxide engine emissions calibrations, Tier 4 certified or compliant exhaust emissions systems and an Uptime compliant rating.

### Mission Critical-Data Center Generator Exhaust Experts

By definition, data centers are critical business operations that demand zero downtime. A single data center can have 20, 30, or more standby generators that all need to be vented, often requiring 30-50 foot stacks. It is our responsibility ...

### Mission Critical-Data Center Generator Exhaust Experts

Chimney Works is a Schebler Chimney Systems exclusive distributor for data center generator exhaust systems. We know these systems are Mission Critical, and our experts and partners build your systems to be reliable.

### Elevator Shaft Exhaust

Elevator Shaft Exhaust Elevator shafts require proper air moving equipment to provide smoke control in the event of a fire. Pressurization is

used to prevent smoke from migrating through elevator shafts to other floors, similar to how ...
