

## European Solar and Energy Storage Solutions

# Debugging of photovoltaic earthquake-resistant bracket

## Overview

---

Can buckling-restrained brace be used in earthquake-resistant design?

Explore some innovative applications of BRBs in earthquake-resistant design of buildings. As an earthquake-resistant structural element, buckling-restrained brace (BRB) not only adds strength and stiffness but provides excellent energy absorption capability to a structure.

What happened to BRB frames after the Northridge earthquake?

After the Northridge Earthquake in 1994, researchers in the U.S. began to re-examine existing steel frame designs and show an increased interest in exploring the potential and benefits of BRB frames . Research on BRBs was therefore accelerated.

Are ground mounting steel frames suitable for PV solar power plant projects?

In the photovoltaic (PV) solar power plant projects, PV solar panel (SP) support structure is one of the main elements and limited numerical studies exist on PVSP ground mounting steel frames to be a research gap that has not be addressed adequately in the literature.

Can a BRB withstand a small earthquake?

The core brace of a BRB is designed to yield under large earthquakes, but remain elastic for small earthquakes. Since energy dissipation is not effected until yielding occurs in the core brace, the use of viscous dampers (VD) to dissipate energy under small earthquake excitations may be beneficial.

Can steel braces be used for seismic design & retrofit?

Steel braces are often used for seismic design and retrofit of steel frame structures. Steel braced frames have been shown to exhibit good seismic performance under strong earthquakes. However, as shown in Fig. 1, steel braces are prone to buckling under strong dynamic loads caused by earthquake and wind.

Do steel braces protect against earthquakes?

The use of damping devices has gained popularity because they have been proven to be effective against severe structural damage from large earthquakes. Steel braces are often used for seismic design and retrofit of steel frame structures. Steel braced frames have been shown to exhibit good seismic performance under strong earthquakes.
