

## European Solar and Energy Storage Solutions

# Diamond-shaped solar panels

## Overview

---

What is the difference between solar shingles and solar panels?

Solar shingles and solar panels differ in their installation methods. Solar shingles act as a structural roof that achieves two functions: to generate clean energy and to provide a uniform look across the whole roof. Solar panels, on the other hand, are simply solar modules mounted on your roofing sheets, tiles, or shingles.

What is a diamond shaped shingle roof?

The traditional slate and shingle roofs in the Swiss Alpine region inspired the design of the diamond-shaped dragon-scale pattern. Solar shingles are more durable than most standard roofing materials, even in harsh weather conditions like hail, snow, rain and high wind.

What is a SunStyle solar roof?

A SunStyle solar roof is a type of solar roof that can be integrated stylishly into any building, even those with complex roof layouts, considering their unique shape and any protrusions like chimneys or skylights. The SunStyle solar roof has an extremely low construction height.

What are solar panels and how do they work?

Solar panels, also known as solar modules, are added to your roofing sheets, tiles, or shingles as solar roof shingles. They function by converting sunlight into electricity. However, solar panels are added with a second set of building materials and can sometimes have limits based on protrusions like chimneys, vents, or skylights.

What are SunStyle ® solar shingles?

SunStyle ® solar shingles are a premium option that provides a fully-uniform aesthetic with a single set of building materials. The cost of installing these solar shingles depends on the size and complexity of your roof, and the active

solar system size.

How does a solar roof system work?

A solar roof system like SunStyle works by having a solar designer place active shingles in key locations and then complete the roof with similarly designed inactive shingles. This allows for a uniform look around vents, skylights, chimneys or other protrusions. Shingles that can be cut on site will be used for this purpose.
