Electricity generated by one wind turbine

Overview

A wind turbine turns wind energy into electricity using the aerodynamic force from the rotor blades, which work like an airplane wing or helicopter rotor blade. When wind flows across the blade, the air pressure on one side of the blade decreases.

Utility-scale electricity generation using wind is one of the lowest-priced energy sources available. Here are a few reasons why wind turbine renewable energy often results in lower power bills for consumers: Lower fuel costs: Once a wind turbine is installed, it generates electricity without the need for ongoing fuel purchases.

Total annual U.S. electricity generation from wind energy increased from about 6 billion kilowatthours (kWh) in 2000 to about 434 billion kWh in 2022. In 2022, wind turbines were the source of about 10.3% of total U.S. utility-scale electricity generation.

Most turbines automatically shut down when wind speeds reach about 88.5 kilometers per hour (55 miles per hour) to prevent mechanical damage. This reduces electricity production when high winds occur and people need continuous power from the wind. They also don't produce electricity if the wind is blowing too slowly.
