Overview

What is the purpose of a duct system?

The purpose of a duct system is to transmit air from the central air source to the air diffusers located in the building control zones. Figure below shows a central heating furnace connected to supply and return air ductwork. The furnace is connected to the air plenum at the starting point.

What is energy efficient duct design?

Designing air distribution systems to avoid excessive duct lengths/fittings, high air velocities, and pressure drop can have a major impact on energy. Energy-efficient duct design also includes locating ducts to minimize thermal and leakage losses. These practices promote proper air distribution while reducing noise and energy use.

What are the principles of air duct design?

The two fundamental concepts, which govern the flow of air in ducts, are the laws of conservation of mass and conservation of energy. From these principles are derived the basic continuity and pressure equations, which are the basis for duct system designs.

What is potential energy in HVAC duct design?

Potential energy is due to elevation above a reference datum and is often negligible in HVAC duct design systems. Consequently, the total pressure (or total energy) of air flowing in a duct system is generally equal to the sum of the static pressure and the velocity pressure. As an equation, this is written:.

What is total energy per unit volume in duct system?

The total energy per unit volume of air flowing in a duct system is equal to the sum of the static energy, kinetic energy and potential energy. When applied to airflow in ducts, the flow work or static energy is represented by the static pressure of the air, and the velocity pressure of the air represents the kinetic

energy.

What is a distributed return duct system?

In a distributed return duct system, each room has a return duct that provides a pathway for air to flow back to the air handler. In a central return duct system, or whole-house return, return grilles are located in central locations on each floor, usually close to the air handler.
