What is liquid immersion cooling?

In liquid immersion cooling, the batteries are completely submerged in a dielectric liquid that absorbs and dissipates heat through natural convection or forced circulation. This technique has been successfully applied to high-performance computing systems, but its potential for battery cooling is still underexplored.

What is liquid immersion cooling for batteries?

Liquid immersion cooling for batteries entails immersing the battery cells or the complete battery pack in a non-conductive coolant liquid, typically a mineral oil or a synthetic fluid.

How does liquid immersion cooling affect battery performance?

The graph sheds light on the dynamic behavior of voltage during discharge under liquid immersion cooling conditions, aiding in the study and optimization of battery performance in a variety of applications. The configuration of the battery and the direction of coolant flow have a significant impact on battery temperature.

Can a liquid immersion coolant be used to cool Lib cells?

Jithin et al. numerically analyzed liquid immersion cooling for LIBs using different coolants, including deionized water, mineral oil, and an engineered fluid. The results revealed that improving the specific heat and thermal conductivity of the coolant can be beneficial for cooling LIB cells under high-discharge conditions.

What is the liquid immersion cooling method used in this project?

The liquid immersion cooling method used in this project involved a radiator, a pump, and a coolant, which was de-ionized water as shown in Fig. 2. The coolant was used to cool  $6 \times 5$  18,650 Li-ion batteries, each with a capacity of

2000mAh and a voltage of 3.7V. The pump was placed in a reservoir where the coolant was stored.

How does an immersion cooling system work?

An immersion cooling system is a type of cooling mechanism used to dissipate heat generated by electronic components or machinery. It works by circulating a liquid coolant through a system of pipes, tubes, or channels, absorbing the heat and carrying it away from the components to be cooled .
