Energy storage self-luminous induction system

Overview

Can a self-luminous wood composite be used for thermal and light energy storage?

Yang et al. (2019) fabricated a self-luminous wood composite for thermal and light energy storage via impregnating a PCM/long after-glow luminescence (LAL) combination into delignified wood. However, since LAL materials applied in PCMs is very rare, thermal energy and light energy storage still have some knowledge gaps.

How does self-luminous wood composite reduce energy consumption?

In addition, self-luminous wood composite has long afterglow time (about 11 h), which can absorb and store visible and ultraviolet light, and release green light in the dark (Fig. 1 b). The self-luminous wood composite can store both thermal energy and light energy, thus reduce energy consumption.

Can luminous nanoparticles be used for light energy storage?

to fabricate a novel luminous and translucent wood composite by introducing luminous nanoparticles into a wood template. However, only a few researchers have introduced luminous materials into the PCMs to fabricate composite PCMs for light energy storage usage.

How do self-luminous SS-cpcms achieve storage and release thermal/light energy?

4drops drastically after the simulated sunlight irradiation is turned o, and a phase transition platform appears, corresponding to the liquid-solid phase change process of PEG and energy release. Thus, self-luminous ss-CPCMs can achieve storage and release thermal/light energy thanks to the reversible phase process.

What are self-charging energy storage devices?

The reported self-charging energy storage devices are mainly based on LIBs

and supercapacitors. These devices can collect and convert mechanical energy into electric energy in the surrounding environment, and then store the scavenged energy as chemical energy.

Do self-luminous wood composites exhibit thermal properties and luminescence performance?

The self-luminous wood composites exhibit both thermal properties and luminescence performances. However, there is not a simple sum on the capability. The addition of LAL particles can improve the thermal conductivity of self-luminous wood composites.
