Far East Microgrid

Overview

Do Island microgrids work in the East China Sea?

Three representative island microgrids in the East China Sea are demonstrated. Key technologies such as control technology and energy management for island microgrids are studied. Renewable energy penetration is discussed for the design and operation of island microgrids.

What are the island microgrids?

Table 1. Summary of the island microgrids. Recently, three unique stand-alone microgrid projects have been built at Dongfushan Island, Nanji Island, and Beiji Island in the east China, with an aim to replace diesel with renewable energy to improve renewable energy utilization, enhance power supply reliability, and reduce power supply cost.

Where are microgrids located in China?

Three stand-alone island microgrids with distinctive features have been built and are operating normally, which are located in the Dongfushan, Beiji, and Nanji islands along the Zhejiang coast, as shown in Fig. 1. The three islands are about 40–80 km apart. Particularly, Dongfushan is the farthest eastern inhabited island in China.

Are microgrids a potential for a modernized electric infrastructure?

1. Introduction Electricity distribution networks globally are undergoing a transformation, driven by the emergence of new distributed energy resources (DERs), including microgrids (MGs). The MG is a promising potential for a modernized electric infrastructure , .

What is the EP of a microgrid?

The EP of each island microgrid is about 60% and these islands are expected to switch from the power supply mode dominated by DE generators to the one dominated by renewable energy. The increased EP values in Table 4 indicate

the reduced diesel consumptions on the three islands, producing positive economic and environmental impacts.

Should res-based microgrid be built away from the mainland?

According to the above analysis, it is desirable to build an RES-based microgrid on the islands away from the mainland to effectively reduce the power generation cost, protect the environment, and increase the reliability of power supply. However, from the previous analysis, the following questions need to be discussed.
