Fully submerged liquid-cooled energy storage system

Overview

What is immersion cooling energy storage battery cabinet?

Immersion cooling energy storage battery cabinet to improve heat exchange efficiency and stability of immersion cooled battery systems. The cabinet has a housing with an accommodating cavity for the battery module. The battery module is fully submerged in a cooling liquid.

What is a liquid cooled battery system?

Immersed liquid-cooled battery system that provides higher cooling efficiency and simplifies battery manufacturing compared to conventional liquid cooling methods. The system involves enclosing multiple battery cells in a sealed box and immersing them directly in a cooling medium.

What is a lithium battery pack immersion cooling module?

A lithium battery pack immersion cooling module for energy storage containers that provides 100% heat dissipation coverage for the battery pack by fully immersing it in a cooling liquid. This eliminates the issues of limited contact cooling methods that only cover part of the battery pack.

What is a liquid cooling module for electric vehicle batteries?

Liquid cooling module for electric vehicle batteries that directly immerses the battery cells in coolant to improve cooling efficiency and balance temperatures. The module has a liquid cooling cavity with an accommodating section for the battery pack. The pack is immersed in coolant that flows in and out through pipes.

What is the difference between direct liquid cooling and immersion cooling?

For conditioning, direct liquid cooling (immersion cooling) employs a liquid such as mineral oil or silicone oil in close interaction with the lithium batteries. The battery cells are submerged or partly submerged in the cooling liquid, which considerably minimizes the interface thermal performance and

improves system cooling.

What is a liquid cooling plate?

A liquid cooling plate with flowing medium cools the battery further. Temperature sensors monitor the battery and adjust the pump flow rate to maintain optimal temperature range. This immersion cooling provides higher heat transfer compared to air or indirect liquid cooling.
