Generator Water Jacket Reliability Wind Power

Overview

Can jacket foundations be optimized for offshore wind turbines?

In this paper, an efficient structural optimization design method for jacket foundations of offshore wind turbines is proposed and demonstrated by examining the optimal designed jackets for 10 MW wind turbines at 30 m, 50 m and 70 m WDs.

What are the design variables of jackets for offshore wind turbines?

Jackets of offshore wind turbine for different WDs. The design variables of jackets for offshore wind turbines are the top width, base width, height of each section, leg and brace dimension parameters of each section and pile dimension parameters, which are sufficient for jacket design. The design variables of jackets are shown in Table 2.

How efficient is wind turbine jacket optimization design based on surrogate models?

To sum up, the efficiency of wind turbine jacket optimization design based on surrogate models is 71.78–87.00 times higher than that of direct optimization design on finite element models, and this means that 98.61%–98.85% of the structural optimization time is saved.

What type of wind turbine should be installed on a high fidelity jacket?

an 8 MW turbine installed on a high fidelity 3-legged jacket is considered. This is in line with most of today's designed deep water offshore wind turbines. The foundation is modelled in Ramboll's in- to represent the typical load level from leading industrial turbines. the soil via three piles, which are included in the model.

Why do wind turbine jackets need a more conservative design scheme?

The 50-years static simplification of wind turbine loads and the most unfavorable wave loads lead to a more conservative jacket design scheme [

36, 37], which will also be further proven through coupled dynamic analysis for optimized jackets (Section 4.2).

Do jacket wind turbines recur under static extreme loads?

The structural responses of jacket wind turbine systems under the equivalent static extreme loads with a recurrence period of 50 years are mainly considered in structural optimization design, and the key optimization variables of jackets are determined by parameter sensitivity analysis.
