# Generator inlet air temperature control

## Overview

What is a gas turbine inlet temperature control system?

These systems include methods for intake heating under low loads and intake cooling under basic loads, which can be used to change the intake temperature of the compressor under a variety of operational conditions. The heat exchanger of gas turbine inlet temperature control system is a key equipment.

How to select the optimal inlet air cooling system for intercooled gas turbines?

It is important to note that the optimal inlet air cooling system for intercooled gas turbines can be selected through a thermo-economic analysis that factors in different ambient temperatures and the ISO relative humidity level of 60%. Fig. 9. Required cooling capacity for an inlet air cooling system. 6.2. Inlet air temperature drop.

Can Inlet air heating improve gas turbine efficiency?

Inlet air heating (IAH) technology is gradually gaining attention as a favorable means of load regulation. Liu et al. proposed a heating system that used the waste heat of exhaust gas to heat the compressor inlet air. The results showed that an increase in temperature can improve the gas turbine efficiency considerably, for a given load.

Can Inlet absorption cooling increase power output of a gas turbine?

Wang and Chiou [ 18] claimed that the thermal efficiency and power output of a given gas turbine cycle (namely topping cycle) could be increased by 5.16% and 12% with inlet absorption cooling system.

Can compressor inlet air cooling improve the performance of gas turbine power plants?

Considering the significant impact of T1 on the cycle performance, compressor inlet air cooling technology is considered as an effective method for enhancing

the performance of gas turbine power plants [ 16 ]. The generated power for a selected gas turbine power plant is expected to be increased by 1% via decreasing T1 for 1 °C [ 17 ].

What are the requirements for a gas turbine inlet temperature regulator?

The gas turbine inlet temperature regulator has strict requirements for the resistance of the air flow outside the tube. Generally, the operating resistance is required to be controlled below 150 Pa, which requires that the air flow speed should not be too high.
