# Has the wind power generation stopped

## Overview

---

July 24 (Reuters) - The amount of electricity produced by wind farms in the U.S. fell to a 33-month low on Monday, forcing power generators to crank up natural-gas fired plants to keep air conditio.

July 24 (Reuters) - The amount of electricity produced by wind farms in the U.S. fell to a 33-month low on Monday, forcing power generators to crank up natural-gas fired plants to keep air conditio.

U.S. electricity generation from wind turbines decreased for the first time since the mid-1990s in 2023 despite the addition of 6.2 gigawatts (GW) of new wind capacity last year. Data from our Power Plant Operations Report show that U.S. wind generation in 2023 totaled 425,235 gigawatthours (GWh), 2.1% less than the 434,297 GWh generated in 2022.

The U.S. Department of Energy today released three reports showing record growth in land-based wind energy, significant expansion of the pipeline for offshore wind projects, and continued decline in the cost of wind energy generation.

The amount of electricity produced by wind farms in the U.S. fell to a 33-month low on Monday, forcing power generators to crank up natural-gas fired plants to keep air conditioners humming.

Slower wind speeds from the naturally occurring El Niño weather phenomenon drove lower generation. Consultancy DNV, which advises on US wind projects, saw a 5 per cent decline in wind. Why did wind power fall last year?

Slower breezes weakened wind generation across the country last year, leading to the first decline in output in almost three decades. The wind is blowing slower these days in the US. Wind power fell last year for the first time since the 1990s, despite new installed capacity, the Energy Information Administration reported last week.

How has wind power changed over the last year?

U.S. wind capacity increased steadily over the last several years, more than tripling from 47.0 GW in 2010 to 147.5 GW at the end of 2023. Electricity generation from wind turbines also grew steadily, at a similar rate to capacity, until 2023.

How much wind power did the US generate in 2023?

The US saw the addition of 6.2 gigawatts (GW) of new wind capacity last year, but data from the US Energy Information Administration's " Power Plant Operations Report " show that US wind generation in 2023 totaled 425,235 gigawatt-hours (GWh) – 2.1% less than the 434,297 GWh generated in 2022.

What's going on with wind energy?

The U.S. Department of Energy today released three reports showing record growth in land-based wind energy, significant expansion of the pipeline for offshore wind projects, and continued decline in the cost of wind energy generation.

Why is US wind power declining?

The capacity factor for the country's wind fleet — how much energy it's actually generating versus its maximum possible output — declined to an eight-year low of 33.5%. Most of that decline was driven by the central US, a region densely dotted with turbines.

Why did wind generation decline in 2023?

The 2023 decline in wind generation indicates that wind as a generation source is maturing after decades of rapid growth. Slower wind speeds than normal affected wind generation in 2023, especially during the first half of the year when wind generation dropped by 14% compared with the same period in 2022.

## Has the wind power generation stopped

---

### How Wind Power Works

The cost of utility-scale wind power has come down dramatically in the last two decades due to technological and design advancements in turbine production and installation. In the early 1980s, wind power cost about 30 cents per kWh. In ...

### (PDF) Impact of Wind Generation in determining Spinning and Stopped ...

Wind turbine generation has been gaining more relevance over the years with his growth in the energy mix. However, the increase of production of wind energy leads to an increase in the ...
