How much does a microgrid cost

Overview

A 2018 study conducted by the National Renewable Energy Laboratory found that microgrids in the Continental U.S. cost an average of \$2 million-\$5 million per megawatt.

A 2018 study conducted by the National Renewable Energy Laboratory found that microgrids in the Continental U.S. cost an average of \$2 million-\$5 million per megawatt.

A typical residential solar microgrid might cost around \$20,000, while a commercial-scale system could cost millions of dollars. The cost of a solar microgrid also depends on the type of system.

A 2018 study by the National Renewable Energy Laboratory found that microgrids for commercial and industrial customers in the US cost about \$4 million/MW, followed by campus/institution microgrids .

Costs for larger-scale microgrids for campuses, industries, or entire communities can run into the millions of dollars, with mean costs between \$2.1 and \$4 million dollars.

According to NREL, community microgrids have the lowest mean cost, at \$2.1 million/MW of DERs installed. How much does a solar microgrid cost?

The cost of a solar microgrid depends on many factors, including the size and location of the system. Solar microgrids range in size from a few kilowatts to several megawatts. A typical residential solar microgrid might cost around \$20,000, while a commercial-scale system could cost millions of dollars.

What is a microgrid cost model?

The National Renewable Energy Laboratory was commissioned by the U.S. Department of Energy to complete a microgrid cost study and develop a microgrid cost model. The goal of this study is to elucidate the variables that have the highest impact on costs as well as potential areas for cost reduction. This study consists of two phases.

How much does a microgrid controller cost?

Controller costs per megawatt range from \$3,500/MW to nearly \$600,000/MW (excluding outliers), with a mean of \$85,000/MW. The analysis shows that controller costs as a percentage of total microgrid costs are relatively similar among the projects in our database and the NY Prize data despite the wide variety of system sizes, types, and uses.

How much does a microgrid cost per megawatt?

The community microgrid market has a mean cost of \$2.1 million per megawatt of DERs installed.

How much does energy storage cost a microgrid?

In commercial and industrial microgrids, energy storage represents 15% and 25% of the total costs per megawatt, respectively. In commercial microgrids, soft costs account for 43%, while in community microgrids they account for 24%.

Why do microgrids cost so much?

Location and size of the microgrid also play a role, Adams says. Cost can add up for a microgrid if it's located in a place where construction isn't easy, like a dense urban environment, especially if a lot of distribution reconfiguring is necessary. Scale influences price - although not always as one might think.
