# How to connect the energy storage cabinet and the inverter

## Overview

---

With Schneider, installers can use up to three XW inverters in their power distribution panel. With both Schneider and Outback, installers can use the integrated DC power distribution panels with integrated disconnects to parallel several inverters, solar charge controllers and battery cabinets, if that is the most convenient for the site.

The ESS mode is configured to 'Keep batteries charged'. When using a grid-tie inverter, it is connected to the AC output as well. When grid power is available, the battery will be charged with power from both the grid and the PV. Loads are powered from PV when that power source is available.

Connect the Inverter. The inverter is the component responsible for converting DC to AC power. Here are key considerations for connecting the inverter:  
Location: Place the inverter close to the panels to minimize DC power loss but in a location that protects it from extreme weather. Capacity: Ensure the inverter's capacity matches the system's .

Connecting the solar battery storage system to the inverter is a critical step in the installation process. The inverter converts the stored energy direct current (DC) electricity into alternating current (AC) for use in your home.

Connect CCGX to inverter/chargers use RJ45 cable. Connect MPPT to CCGX use VE.direct cable. Connect energy meters to CCGX using the USB to RS485 interface or Zigbee units. Connect smart battery to CCGX, use special RJ45 cable. Connect CCGX to internet via Ethernet cable or WiFi module
