# How to connect the photovoltaic panel meter

## Overview

Here's how a technician tests solar modules with a multimeter: Set the multimeter to DC voltage mode. To connect the multimeter, attach the red lead to the positive terminal of the solar module. Attach the black lead to the negative terminal. Place the solar module in direct sunlight or under a bright artificial light source. Take note of the voltage reading on the multimeter. □□□□.

There are two basic approaches to connecting a grid-tied solar panel system, as shown in the wiring diagrams below. The most common is a "LOAD SIDE" connection, made AFTER the main breaker. The alternative is a "LINE OR SUPPLY-SIDE" connection made BEFORE the main breaker.

Wiring solar panels together can be done with pre-installed wires at the modules, but extending the wiring to the inverter or service panel requires selecting the right wire. For rooftop PV installations, you can use the PV wire, known in Europe as TUV PV Wire or EN 50618 solar cable standard.

This diagram shows an underground installation. As you can see in the solar meter base the wiring actually looks backwards. The wires in the top terminal go out to the solar panels and the wires on the bottom terminals go back and tie in to the utility. A fused disconnect is always used and goes out to the solar panels.

Connecting PV modules in series and parallel are the two basic options, but you can also combine series and parallel wiring to create a hybrid solar panel array. Some solar panels have microinverters built-in, which impacts how you connect the modules together and to your balance of system.
