However, if those aren't available, here are the steps: First, cut off power going into the DC circuit breaker box by switching off the corresponding switch(es). Then remove covers protecting wiring terminals where leads from PV modules enter the house. Now attach the positive probe (red) onto the terminal with a red wire coming out and the negative probe (black) onto the other side with a black wire.

Here's how a technician tests solar modules with a multimeter: Set the multimeter to DC voltage mode. To connect the multimeter, attach the red lead to the positive terminal of the solar module. Attach the black lead to the negative terminal. Place the solar module in direct sunlight or under a bright artificial light source. Take note of the voltage reading on the multimeter. □□□□
