## Overview

The optimum tilt angle is calculated by adding 15 degrees to your latitude during winter, and subtracting 15 degrees from your latitude during summer. For instance, if your latitude is  $34^\circ$ , the optimum tilt angle for your solar panels during winter will be  $34 + 15 = 49^\circ$ .

The optimal tilt angle of photovoltaic solar panels is that the surface of the solar panel faces the Sun perpendicularly. However, the angle of incidence of solar radiation varies during the day and during different times of the year.

The tilt angle for solar panels varies specific to your location latitude, season, and time of day. Typically, an optimal angle sits between  $30^\circ$  and  $45^\circ$ . To maximize the energy conversion efficiency, use proper mount brackets, and adjust the angles and orientation in accordance with time of year and day.

Our guide on solar panel angles explains how adjusting the tilt can optimize energy production, maximizing solar output.

There are two factors in the orientation. The first is the direction, and the second is the tilt angle. Both are independent but vital parts in optimizing orientation for solar panels. The direction is calculated using the azimuth angle of the sun, which is simply a directional measure of the sun in the sky.
