AGC represents a critical interface between energy storage systems and the reliable operation of the modern electrical grid. By providing rapid, flexible, and precise control over energy storage assets, AGC helps to ensure that the grid remains stable and efficient in the face of changing energy landscapes.

In order to improve the automatic generation control (AGC) command response capability of TPU, an operation strategy of hybrid energy storage system (HESS) is proposed in this paper. While assisting TPU to complete the regulation tasks, it gives full play to the advantages of power-type and energy-type energy storage.

The growing integration of renewable energy sources (RESs) into the power grid to tackle climate change is making the network design of the present electrical system more complex every day. Thus, the inertia of the power system is gradually decreasing. Therefore, a minor load perturbation or dynamic system disturbance is the cause of the power imbalance. The control architecture of the .

Automatic generation control (AGC) is primarily responsible for ensuring the smooth and efficient operation of an electric power system. The main goal of AGC is to keep the operating frequency under prescribed limits and maintain
