Infrared imaging of hidden cracks in photovoltaic panels

Overview

How are infrared defect images used in photovoltaic modules?

Firstly, the defect images of open-source photovoltaic modules and their existing problems are analysed; based on the existing problems, image enhancement and data enhancement are performed on the infrared defect images of photovoltaic modules, so that the infrared images meet the requirements of image availability and sample quantity.

How do PV panels differ from infrared thermal imaging?

In contrast to infrared thermal imaging detection in PV panels, the detection of electronic components differs due to their complex and intricate structures. Often, external excitation is required to induce heating for these electronic components.

Is there a fault diagnosis method for PV modules based on infrared images?

Here, a fault diagnosis method for PV modules based on infrared images and improved MobileNet-V3 is proposed.

How can IRT be used to detect and diagnose defects in PV panels?

The integration of IRT with deep learning plays a pivotal role in detecting and diagnosing defects in PV panels [115, 116]. Initially, the technique of IRT is employed to capture thermal images of the PV panels.

How to improve the quality of infrared images of PV modules?

According to the characteristics of low contrast and unbalanced number of images in the dataset, the histogram equalization and Mixup method are used to enhance the quality of infrared images of PV modules, thereby improving the accuracy of PV module fault diagnosis based on infrared images and deep learning methods.

How can IR imaging be used to identify a PV module defect?

Defects on PV modules cause temperature differences and based on this, different types of defects can be identified through the inspection of temperature distribution [6]. IR imaging provides a real-time two-dimensional image of PV module from which temperature distribution of the module surface can be assessed [7].
