Solar cells that combine traditional silicon with cutting-edge perovskites could push the efficiency of solar panels to new heights.

Solar cells that combine traditional silicon with cutting-edge perovskites could push the efficiency of solar panels to new heights.

This review discusses the latest advancements in the field of novel materials for solar photovoltaic devices, including emerging technologies such as perovskite solar cells. It evaluates the efficiency and durability of different generations of materials in solar photovoltaic devices and compares them with traditional materials.

Organic/inorganic metal halide perovskites attract substantial attention as key materials for next-generation photovoltaic technologies due to their potential for low cost, high performance.

A comprehensive study has been presented in the paper, which includes solar PV generations, photon absorbing materials and characterization properties of solar PV cells. The first-generation solar cells are conventional and wafer-based including m-Si, p-Si.

High-efficiency (>20%) materials find applications in large-area photovoltaic power generation for the utility grid as well as in small and medium-sized systems for the built environment. They will enable very large-scale penetration into our energy system, starting now and growing as the cost per kilowatt-hour is reduced further by a factor of .
