# Liquid Cooling Energy Storage System Explanation

## Overview

---

Liquid cooling systems use a liquid coolant, typically water or a specialized coolant fluid, to absorb and dissipate heat from the energy storage components.

Liquid cooling systems use a liquid coolant, typically water or a specialized coolant fluid, to absorb and dissipate heat from the energy storage components.

Liquid cooling is a technique that involves circulating a coolant, usually a mixture of water and glycol, through a system to dissipate heat generated during the operation of batteries.

Liquid cooling is mostly an active battery thermal management system that utilizes a pumped liquid to remove the thermal energy generated by batteries in a pack and then rejects the thermal energy .
