Lithium battery energy storage storage standard requirements

Overview

This document provides an overview of current codes and standards (C+S) applicable to U.S. installations of utility-scale battery energy storage systems.

This document provides an overview of current codes and standards (C+S) applicable to U.S. installations of utility-scale battery energy storage systems.

As part of a robust plan for storing batteries, J3235 highlights the need to properly identify the battery type (s) to be stored and the storage location and the corresponding considerations for containment, fire detection and suppression, emissions management, and run-off controls.

For comparison, 100-megawatt-equivalent capacity storage of each resource type was considered. In the solar-plus-storage scenario, the following assumptions were made: 100-megawatt (MW), 3-hour lithium-ion battery energy storage system coupled with a 50 MW solar photovoltaic system, and a project life of 20 years.

Establishing a domestic supply chain for lithium-based batteries requires a national commitment to both solving breakthrough scientific challenges for new materials and developing a manufacturing base that meets the demands of the growing electric vehicle (EV) and stationary grid storage markets.

Application of this standard includes: (1) Stationary battery energy storage system (BESS) and mobile BESS; (2) Carrier of BESS, including but not limited to lead acid battery, lithiumion battery, flow battery, and sodium-sulfur battery; (3) BESS used in electric power systems (EPS).What is a lithium-ion battery energy storage system (BESS)?

In recent years, companies have adopted lithium-ion battery energy storage systems (BESS) which provide an essential source of backup transitional power. UL and governing bodies have evolved their respective requirements, codes, and standards to match pace with these new technology developments.

What is lithium ion battery storage?

Lithium-Ion Battery Storage for the Grid—A Review of Stationary Battery Storage System Design Tailored for Applications in Modern Power Grids, 2017. This type of secondary cell is widely used in vehicles and other applications requiring high values of load current.

What types of batteries can be used in a battery storage system?

Application of this standard includes: (1) Stationary battery energy storage system (BESS) and mobile BESS; (2) Carrier of BESS, including but not limited to lead acid battery, lithiumion battery, flow battery, and sodium-sulfur battery; (3) BESS used in electric power systems (EPS).

How much energy does a lithium secondary battery store?

Lithium secondary batteries store 150–250 watt-hours per kilogram (kg) and can store 1.5–2 times more energy than Na-S batteries, two to three times more than redox flow batteries, and about five times more than lead storage batteries. Charge and discharge efficiency is a performance scale that can be used to assess battery efficiency.

Should lithium-based batteries be a domestic supply chain?

Establishing a domestic supply chain for lithium-based batteries requires a national commitment to both solving breakthrough scientific challenges for new materials and developing a manufacturing base that meets the demands of the growing electric vehicle (EV) and electrical grid storage markets.

Are batteries a viable energy storage technology?

Batteries have already proven to be a commercially viable energy storage technology. BESSs are modular systems that can be deployed in standard shipping containers. Until recently, high costs and low round trip efficiencies prevented the mass deployment of battery energy storage systems.
