Microgrid Photovoltaic Power Generation Design Specifications

Overview

What is a PV-based microgrid?

The name implies the principle component in a PV-based microgrid is the solar PV system. However, the generated output power of a PV system is dependent on the weather condition, that is, solar irradiance and temperature; and the intermittency in the solar irradiance causes fluctuations in the generated output power of the solar PV system.

Is a solar photovoltaic system a small microgrid?

While pairing a solar photovoltaic system with energy storage to support a single building (behind the utility meter) may be considered a small microgrid by some, for the purposes of this document we use “microgrid” to refer to more complex systems that connect multiple buildings or facilities.

What is a technical assessment for a solar PV-based microgrid?

Technical assessment is based on the nature of the energy sources and the load of the microgrid. For a solar PV-based microgrid, the main technical aspects that are necessary to be considered include rating of PV modules, tilt angle, fill factor, MPPT, PV efficiency, and efficiencies of the power electronic converters.

How can a microgrid improve the reliability of solar PV?

In order to overcome the problems associated with the intermittency of solar PV and enhance the reliability, energy storage systems like batteries and/or backup systems like diesel generators are commonly included in the microgrids [11, 12].

What is a microgrid system?

A microgrid system is a low/medium voltage power network that hosts distributed and renewable energy sources, storage devices, and loads, with a view to best utilise renewable energy resources and reduce dependency on

fossil fuel-based energy sources to ensure reduction in greenhouse gas (GHG) emission.

What is a microgrid power supply?

It refers to the fraction of highest generation capacity of all the generating sources in the microgrid. It is mainly used to pump the power to the system whenever there occurs a power shortage because of the sudden change in the load demand or intermittency in the energy generation from the renewable sources.
