Microgrid relay protection principles

Overview

The approach proposed in the present article assures compatibility of different relay protection devices, the capacity to freely choose different devices on each level and in each protection zone, and the potential for the use of new and different relay protection algorithms implemented in a centralized, decentralized, or mixed variant.

The approach proposed in the present article assures compatibility of different relay protection devices, the capacity to freely choose different devices on each level and in each protection zone, and the potential for the use of new and different relay protection algorithms implemented in a centralized, decentralized, or mixed variant.

Multifunction protective relays are an economical choice for microgrid controls because the hardware is commonly required at the point of interface (POI) to the electric power system (EPS) and at each distributed energy resource (DER). The relays at the POI and DER provide mandatory protection and human safety.

This paper presents such analysis for different relay types by considering various fault and generation conditions in a microgrid. Time-domain simulations are used to identify the scenarios where the relays function correctly as well as the problematic conditions, on which future research should focus.

This paper evaluates directional and adaptive overcurrent protection schemes in microgrids. A microgrid supported by a centralised Battery Energy Storage System (BESS) is chosen for the study.

This report identifies research and development (R&D) areas targeting advancement of microgrid protection and control in an increasingly complex future of microgrids. To identify these areas, we considered microgrids with multiple points of interconnections, combinations of hybrid AC/DC microgrids,
