# Microgrid system for power consumption in mountainous areas

## Overview

---

In this paper, a small hydropower microgrid solution with high applicability is proposed to solve the problem of high line failure rate and long maintenance time, which can improve the reliability of distribution network in mountainous areas. In this scheme, small hydropower and local load constitute a low-cost but efficient microgrid operation .

Microgrid is an important and necessary component of smart grid development. It is a small-scale power system with distributed energy resources. To realize the distributed generation potential, adopting a system where the associated loads and generation are considered as a subsystem or a microgrid is essential.

The proposed energy management system can simultaneously detect electricity theft and implement demand response tactics by employing time-of-use pricing principles and.

This paper presents a review of the microgrid concept, classification and control strategies. Besides, various prospective issues and challenges of microgrid implementation are highlighted and explained. Finally, the important aspects of future microgrid research are outlined.

The capacity of small and medium-sized pumped stor-age power plants, wind power, and photovoltaic power generation in the microgrid is configured in accordance with the water and power requirements of agricultural irrigation.
