# Optimal capacity ratio of photovoltaic inverter

## Overview

---

An optimal PSR of 1.19 is identified, balancing energy capture (up to 2000W inverter capacity) and economic efficiency. This approach promotes cost-effective inverter selection and wider PV adoption.

An optimal PSR of 1.19 is identified, balancing energy capture (up to 2000W inverter capacity) and economic efficiency. This approach promotes cost-effective inverter selection and wider PV adoption.

The PSR is the ratio of the inverter's rated power to the total rated power of the connected PV modules and is crucial to maximizing energy yield and income.

Highlights Using 1-s data instead of 1-h data is beneficial. Nordic conditions increase the optimal sizing ratio. We find an optimal array-to-inverter sizing ratio of 1.6–2.17. The ratio is higher on smaller system sizes. Should inverter capacity and PV array power be rated at a ratio?

However, the authors recommended that the inverter capacity and PV array power must be rated at 1.0:1.0 ratio as an ideal case. In the second study, B. Burger tested the two types of PV panel technologies to match the inverter Danfoss products with the PV array-rated power in sites around central Europe.

What is a good inverter ratio for a thin film PV plant?

The suggested ratio ranged from 1.06 to 1.11 for the Thin-Film PV plant . According to ABB Solar , the inverter might be sized between the PV array power and active power of the inverter ratings (0.80 to 0.90).

How to improve PV inverter lifetime?

In response to this problem, the literature proposed a novel control strategy to limit the power generation, thereby improving the PV inverter lifetime. For a specific photovoltaic inverter system, there should be an optimal PV system capacity ratio and power limit value, taking into account inverter damage and

increasing power generation.

What happens if PV system capacity ratio is greater than 1?

PV system capacity ratio and power limit. When the PV system capacity ratio is greater than 1, there will be excess power supply. The output power should be maintained when the photovoltaic array power supply is lower than the power limit level.

Which dimensioning factor should be used for PV inverter sizing?

For a broad range of inverter sizing values from 0.80 to 1.10, the adjustment dimensioning factor (DF) may be used according to the specific location in their simulation . However, as larger inverters cost more per watt, the optimal ratio must not be larger than 20% of the power rating of the PV array.

How much power stability should a PV inverter have?

When designing and sizing, the recommended value should be adjusted between 0.90 and 0.99. However, as DC/AC increases, the inverter is more likely to derate. The preliminary power stability of PV technologies was confirmed below 1%, while only a few cases showed more than 4%, according to other authors .
