Overview

Should a ground bond be opened in a PV system?

For safety while testing a resolving ground-faults in a PV array, the PV system ground bond must be opened to prevent circuit paths through the system ground bond. Larger three-phase inverters that predate 2005 may not have an OCPD in the ground fault detector, so large currents may be flowing.

Can a PV system use a fuse as a ground detector?

In general, PV systems that use a fuse as a ground detector have a very low impedance path to ground at the inverter, making the problem observed in Europe extremely unlikely for PV systems with a fuse as a ground detector. Figure 8. Monitor in external enclosure Figure 9. PV output circuit combiner equipped with residual current monitor.

Are DC ground faults in PV arrays dangerous?

Dc ground faults in PV arrays are among the most hazardous electrical problems that can occur in a PV array and should be approached carefully according to the best safety practices. PV systems, and especially ground faults, are hazardous because of lethal voltages; ground faults are also hazardous to property because they can start fires.

What is a PV array ground fault?

1. Introduction A PV array ground fault is an electrical pathway between one or more array conductors and earth ground. Such faults are usually the result of mechanical (Wills et al., 2014), electrical, or chemical degradation of photovoltaic (PV) components, or mistakes made during installation.

What happens if a PV string circuit does not have a ground fault?

A PV string circuit without a ground fault will have open circuit voltage (Voc) between positive and negative conductors. It will have zero volts from positive to ground and from negative to ground. When a ground fault is present,

measurement will show Voc between positive and negative conductors.

How do I know if my PV inverter is grounded?

Verify that none of the grounded feeders in the PV output circuit combiner have current on them. Close all the fuse holders and dc disconnects on the array side of the main dc disconnect at the inverter. Verify that there is no solid voltage reading between the grounded conductor and the ground.
