Overview

Which microcontroller is best for a PV inverter?

The localized MPPT at each panel improves the performance of the system under partial shading and unmatched panel conditions. The Texas Instruments C2000 microcontroller family, with its enhanced peripheral set and optimized CPU core for control tasks, is ideal for controlling the power conversion. Figure 1. Grid Tied PV Inverter.

How does a PV inverter work?

The PV panel is a non-linear DC source; an inverter must feed current into the grid, and a maximum power tracking algorithm must maximize power from the panel. Therefore the key challenge in any PV inverter system design is to feed a clean current into the grid while maintaining the maximum power point of the panel.

How to run a PV inverter system?

The objective of this build is to run the full PV inverter system with closed current loop and DC bus voltage control. To connect the PV inverter to grid, a precise state machine must be followed to start the flyback stage, connect the relay, and start the inverter.

Which microcontroller is best for solar power conversion?

The Texas Instruments C2000 microcontroller family, with its enhanced peripheral set and optimized CPU core for control tasks, is ideal for these power conversion applications. The solar explorer kit shown in Figure 2 has different power stages that can enable the kit to be used in a variety of these solar power applications.

Which microcontroller is used in solar micro inverter kit?

All of the key functions are implemented on the F28035 MCU for the Solar Micro Inverter kit. A C2000 piccolo microcontroller with its on-chip PWM, ADC,

and analog comparator modules can implement complete digital control of a micro inverter system. Figure 4 shows a simplified diagram of different stages present on the Solar Micro Inverter kit.

What is a photovoltaic (PV) panel?

The solar panel or PhotoVoltaic (PV) panel, as it is more commonly called, is a DC source with a non-linear V vs I characteristics. A variety of power topologies are used to condition power from the PV source so that it can be used in variety of applications such as to feed power into the grid (PV inverter) and charge batteries.
