The photo-generated current is a function of the absorption coefficient, $\alpha (\lambda)$ [m⁻¹], of the semiconductor material and is given by an integral expression.

The harmonic characteristics of PV inverters in grid-connected operation are studied in this paper. Using the output impedance of PV inverters in the positive and negative sequence coordinate system, a passive impedance network of PV inverter grid-connected system is established, and the harmonic voltage amplification coefficient of PCC is .

The proposed control strategy for dual two-level inverter (DTLI)-based PV system includes two cascaded loops: (i) an inner current control loop that generates inverter voltage references, (ii) an outer dc-link voltage control loop to generate current reference.

This paper proposes a generalized method to include the load and source effects to the dynamic model of a photovoltaic inverter. The method can be used to include the source impedance of the photovoltaic generator and impedance of the distribution line in the small-signal model of the photovoltaic inverter. I. INTRODUCTION.
