How is axonometry selected?

The most acceptable kind of axonometry is selected based upon the key design features of a product or, alternatively, one of the standard kinds of axonometric projections is chosen with corresponding justifications. The product primary orthogonal coordinate system  $Oxyz$  is selected and set for the dimensions .

What is profile axonometry?

When the axonometric plane of projection  $\Pi'$  is profile  $\Pi 3$  plane of projection, the axonometric projection is called profile axonometry. When the axonometric plane of projection  $\Pi'$  is any free  $\Pi$  plane of projection, the axonometric projection is called any certain free axonometry or any axonometry. 3.

What is horizontal axonometry?

When the axonometric plane of projection  $\Pi'$  is the horizontal  $\Pi 1$  plane of projection, then the axonometric projection is called horizontal axonometry. When the axonometric plane of projection  $\Pi'$  is frontal  $\Pi 2$  plane of projection, the axonometric projection is called frontal axonometry.

What is front view axonometry?

However, by definition, the front view gives “the fullest representation about the form and the dimensions of a subject” [26 – 32]. Axonometry construction is facilitated if it is started with the image of the orthogonal projection reflecting the greatest quantity of constructive elements of a product.

What is rectangular axonometry?

If the angle  $\varphi$  between the projection direction  $s'$  (projection ray  $AA'$ ) and picture plane  $\Pi'$  along a straight line is  $\varphi = 90^\circ$ , then the axonometric projection is called as rectangular axonometry.

What are axonometric properties?

The axonometric (axonometric projection) object possesses visualization, convertibility, and measurability. Let's consider the essence of these properties of axonometry and the means by which visualization, convertibility, and measurability of the one-picture axonometric image of object are obtained.
