Photovoltaic panel scene measurement specifications and standards

Overview

Why are international standards important in the photovoltaic industry?

ABSTRACT: International standards play an important role in the Photovoltaic industry. Since PV is such a global industry it is critical that PV products be measured and qualified the same way everywhere in the world. IEC TC82 has developed and published a number of module and component measurement and qualification standards.

What is the minimum array area requirement for a solar PV inverter?

Although the RERH specification does not set a minimum array area requirement, builders should minimally specify an area of 50 square feet in order to operate the smallest grid-tied solar PV inverters on the market.

Do reference spectral irradiance standards improve photovoltaic concentrating system design?

D. Myers, K. Emery, C. Gueymard, Proposed reference spectral irradiance standards to improve photovoltaic concentrating system design and performance evaluation, in: Proceeding of the 29th IEEE Photovoltaic Specialist Conference, IEEE, 2002.

Do I need to meter a photovoltaic system?

It is assumed that aluminum framed photovoltaic (PV) panels mounted on a “post” and rail mounting system, the most common in the industry today, will be installed by the homeowner. While metering the system is encouraged, the specification does not address system wiring elements for associated system sensors or monitoring equipment.

How are PV current and voltage measurements made?

Fig. 2 is an electrical block diagram that illustrates how PV current-voltage measurements are made. A four-wire (or Kelvin) connection to the device under test allows the voltage across the device to be measured by avoiding

voltage drops along the wiring in the current measurement loop.

What is the I V curve of a PV device under illumination?

The I - V curve of a PV device under illumination is a strong function of temperature, which must be accounted for in performance measurements . Typically, I_{sc} has the smallest temperature dependence, which is caused by the semiconductor bandgap shifting to longer wavelengths with higher temperatures.
