

## European Solar and Energy Storage Solutions

# Photovoltaic panel sediment

## Overview

---

Does a photovoltaic panel reduce runoff and sediment in a slope?

The impact of a photovoltaic (PV) panel on runoff and sediment in a slope was tested. The key impact of the PV panel is preventing soil detachment by raindrop impacts. The PV panel slope produced 27 %–63 % less soil erosion than the control slope. The PV panel delayed runoff start time under rainfall with heavy rainfall intensities.

How do photovoltaic panels affect air humidity and soil water content?

Photovoltaic panels can affect air humidity and soil water content by moderating the photosynthetically active radiation (PAR) received (Weinstock and Appelbaum, 2009; Lu, 2013), as well as by significantly reducing wind speed and turbulence (Armstrong et al., 2016; Zhao, 2016; Yin et al., 2017).

Do photovoltaic power stations affect benthic ecosystems and sediment carbon storage?

Photovoltaic power stations (PVPSs) on coastal tidal flats offer benefits, but the lack of information on the effects of PVPSs on benthic ecosystems and sediment carbon storage can hamper the development of eco-friendly renewable energy. We sampled the macrobenthos and sediment cores at a PVPS on a coastal tidal flat in eastern China.

Does a PV panel produce less sediment flux at the outlet?

However, the slope with the PV panel produced 27 %–63 % less sediment flux at the outlet than the control slope, especially under heavy rainfall.

Does PV panel construction affect soil phosphorus and soil pH?

In farmland ecosystems, the soil available phosphorus (ln RR = 2.363, [0.279, 4.448], p = 0.026) and soil pH (ln RR = 0.154, [0.003, 0.304], p = 0.045) were higher within PV panel plots versus controls, whereas the soil pH (ln RR = -0.108, [-0.136, -0.081], p < 0.001) decreased with PV panel construction in

grassland ecosystems.

Do PV panels prevent soil detachment by raindrop impacts?

The key impact of the PV panel is preventing soil detachment by raindrop impacts. The PV panel slope produced 27 %–63 % less soil erosion than the control slope. The PV panel delayed runoff start time under rainfall with heavy rainfall intensities. PV panels on hillslopes may have the potential to retain soil organic matters. Abstract
