The optimum tilt angle is calculated by adding 15 degrees to your latitude during winter, and subtracting 15 degrees from your latitude during summer.

The optimum tilt angle is calculated by adding 15 degrees to your latitude during winter, and subtracting 15 degrees from your latitude during summer.

The tilt angle of solar panels is the angle made by solar panels with the ground surface. It is denoted by the symbol  $t$ . The angle is always positive and between  $0^\circ$  and  $90^\circ$ .

Solar panel tilt angle is the angle formed by your solar panels and the ground below them. A panel laying flat forms a  $0^\circ$  angle, whereas a panel placed upright forms a  $90^\circ$  angle.

The optimal tilt angle for fixed solar panels, as per a rule of thumb, is equal to the latitude of your location. For example, San Diego is at  $32.71^\circ$  N, so the tilt angle in San Diego is  $33^\circ$ .

For most residential installations in the United States, a tilt angle between  $30^\circ$  and  $45^\circ$  is common.
