The first is the one you're likely most familiar with – photovoltaics, or PV. These are the panels you've seen on rooftops or in fields. When the sun shines onto a solar panel, photons from the sunlight are absorbed by the cells in the panel, which creates an electric field across the layers and causes electricity to flow.

NFPA 1 provides guidance on how solar photovoltaic panels must be installed on the roofs of homes.

Residential solar power still generates less electricity than large utility-scale solar, such as solar panel farms. And all solar power together generates only a small amount of the electricity used in the United States. In 2021, solar generated just 3% of all utility-scale electricity, a far smaller share than natural gas (38%) or coal (22%).

Your solar energy installer and local utility company can provide more information on the exact steps you will need to take to power your home with solar energy. Investigate your home's energy efficiency. Assess your solar potential and any limitations. Assess your options for going solar.

**Benefit 1:** Solar panels are increasingly affordable. Residential solar is more affordable than ever, especially with the extension of the federal residential solar tax credit. Taxpayers can claim a 30% tax credit on the cost of solar systems on their income taxes.
