# Photovoltaic panels with different powers connected in series

## Overview

If we have two or more solar panels with the same voltage but with different current, it is NOT possible to wire them in series. Nonetheless it is possible to wire them in parallel.

If we have two or more solar panels with the same voltage but with different current, it is NOT possible to wire them in series. Nonetheless it is possible to wire them in parallel.

To connect solar panels in a series, you connect the positive wire of each panel to the negative wire of the next and vice versa, alternating in this way.

In a solar panel system wired in series, the total voltage of each solar panel is summed together, but the amps of electrical current stay the same.

When solar panels are connected in series, their voltage adds up, but the current remains stable and the same as a single panel.

Connecting PV panels in series increases the voltage but amps remain the same, but in parallel connection, current and power output increase.
