Seasonal changes in the photovoltaic panel inclination time

Overview

As a rule of thumb, solar panels should be more vertical during winter to gain most of the low winter sun, and more tilted during summer to maximize the output.

As a rule of thumb, solar panels should be more vertical during winter to gain most of the low winter sun, and more tilted during summer to maximize the output.

As the solar zenith angle changes throughout the day, adjusting panel angles accordingly optimizes energy production. Optimal tilt angles vary with the seasons due to the Earth's axial tilt. Are photovoltaic panels optimal tilt angles?

This study provides estimates of photovoltaic (PV) panel optimal tilt angles for all countries worldwide. It then estimates the incident solar radiation normal to either tracked or optimally tilted panels relative to horizontal panels globally. Optimal tilts are derived from the National Renewable Energy Laboratory's PVWatts program.

Does solar panel tilt angle affect solar radiation collected?

It has been determined that the collected solar radiation is the highest in the monthly changes of the solar panel tilt angle. It was marked that the collected solar radiation decreased in the seasonal and annual solar panel tilt angles, respectively.

Why does the tilt angle of PV panels change?

The optimum tilt angle at the same location changes periodically (Fig. 7) due to the Earth revolution around sun. In summer, when the sun shines more directly on the northern hemisphere, the tilt angle is generally small; winter is the opposite. Adjusting the tilt angle of PV panels according to the season helps capturing more energy.

Should solar panels be tilted to maximize power generation?

To maximize power generation, tilt angle should be adjusted to ensure that PV panels are exposed to direct sunlight. Although sun-tracking system can track sunrays in real time to approach the best tilt angle, the investment is too expensive (or not economical) for both residential users and large solar farms [6, 7].

How are solar panel tilt angles optimized?

Solar panel tilt angles were optimized using isotropic and anisotropic models for the first time in Eskisehir, Turkey. This study applied a mathematical model to identify the ideal tilt angles for solar panels. A combination of selected anisotropic and isotropic models was used in the calculations.

Does tilt angle affect solar energy gains in Iran?

In Tabass, Iran, monthly, seasonal, semi-yearly and yearly adjustments of optimum tilt angle result in annual solar energy gains of 23.15%, 21.55%, 21.23% and 13.76%, respectively, in comparison to horizontally fixed installations .
