Overview

The ideal roof slope is 15-45 degrees. Anything beyond 45 degrees makes installation difficult and limits your solar energy production.

The slope of your roof can affect your solar energy output. The ideal roof slope is 15-45 degrees. Anything beyond 45 degrees makes installation difficult and limits your solar energy production. Solar panels on flat roofs will be put on a rail system which allows us to angle solar panels toward the sun.

Roof pitch or slope is also important factor that you need to consider when calculating solar panel angles. The tilt angle of solar panels should ideally align with the sun's path across the sky to maximize sunlight exposure.

Calculating the Optimal solar panel Angle. As a rule of thumb, solar panels should be more vertical during winter to gain most of the low winter sun, and more tilted during summer to maximize the output. Here are two simple methods for calculating approximate solar panel angle according to your latitude.

The essence of PVGIS is the calculation of the production of your photovoltaic system based on your geographic location and installation information. Nevertheless, you have the option to calculate, based on the electricity production estimate, the cost of photovoltaic electricity per kWh.
