## Overview

Why do we need a smart grid and a microgrid?

The competitive landscape among energy providers and distributors has empowered consumers to not only save money on their energy bills but also incorporate sustainable energy sources into the grid. To efficiently manage electricity distribution, deregulated power systems must include a smart grid and microgrid (MG).

What are the research prospects for a microgrid?

Finally, future research prospects in long-term low-cost energy storage, power/energy balancing, and stability control, are emphasized. 1. Introduction  
A microgrid is a power grid that gathers distributed renewable energy sources and promotes local consumption of renewable energies .

What are the strategies for energy management systems for smart microgrids?

There are many strategies for energy management systems for smart microgrids such as load management, generation management, and energy storage management 4. The control system of a microgrid must continuously analyze and prioritize loads to maintain a balance between power generation and consumption.

Are smart microgrids a threat to energy theft?

Energy theft, including smart microgrids, costs the global energy industry billions of dollars. The dispersed architecture and distributed energy supplies of smart microgrids make them more vulnerable to electricity theft than conventional power grids 5. Smart microgrids can analyze sensor and meter data to identify trends of energy theft.

What are the objectives of a microgrid?

Microgrids, such as the one in this case study (C1), need a clear objective, the

definition of market participants, and the form of energy traded defined. Microgrids can pursue several, often conflicting objectives, such as the increase of the security of energy supply or the integration of local renewable generation into the energy supply system.

How can microgrids improve the reliability of energy supply?

Microgrids, which are a geographically limited group of multiple generation loads and energy resources, can increase the reliability of supply as they offer the potential to provide energy in case of power outages of the superordinate grid.
