Solar Photovoltaic Panels Drought

Overview

How does a solar drought affect solar power?

During a typical solar drought, almost the entire WNA domain consistently experiences reduced solar power with respect to the week-of-the-year (spatial average of 93% of typical values, Fig. 3 e).

Are wind droughts associated with less solar power?

Thus, wind droughts tend to be accompanied by slightly enhanced solar availability. However, wind droughts are consistently associated with slightly less solar power than average over the climatologically sunniest region (indicated by the stippling on the bottom half of the WNA domain in Fig. 3 d).

Can cloudy conditions cause low PV power outputs?

High temperature or clouds, for example, can lead to poorer photovoltaic (PV) power outputs. Here, we assess global changes in the frequency of warm and cloudy conditions that lead to very low PV power outputs.

Are wind and solar droughts associated with extreme climatology and synoptic meteorology?

The purpose of this article was to document the climatology and synoptic meteorology associated with extreme reductions in wind and solar energy resource availability at the weekly timescale over western North America (i.e., wind and solar “droughts”).

When do solar power drought weeks occur?

Solar power drought weeks tend to occur near winter solstice when the seasonal minimum in incoming solar radiation co-occurs with the tendency for mid-level troughs and low pressure systems over the U.S. southwest.

What are compound wind and solar power drought weeks?

Compound wind and solar power drought weeks consist of the aforementioned synoptic pattern associated with wind droughts occurring near winter solstice when the solar resource is at its seasonal minimum.
