The hybrid nanofibres are prepared by interfacial synthesis of a conductive metal-organic framework Ni<sub>3</sub>(2,3,6,7,10,11-hexaiminotriphenylene)<sub>2</sub> (Ni-HITP) onto cellulose nanofibres extracted from Cladophora algae.<sup>18,19</sup> After introducing carboxyls onto the surface of the cellulose by TEMPO (2,2,6,6-

Ultraviolet-visible-near infrared absorption spectra have shown that the CCM film strongly absorbs light (>90%) throughout the solar spectrum range (Fig. 2a) as a result of the highly.

The ionic conduction behaviour of the CCM film along the in-plane direction was investigated using a home-made apparatus (Fig. S7a and b).

We have designed a solar-driven IPG device based on the CCM film (Fig. 5a). A piece of CCM film (1.0 cm × 0.2 cm) was bent to a U-shape and bound onto a piece of polystyrene foam. The.

Because of the formation of a charged surface on the nanoporous CCM film when it is infiltrated by a non-neutral electrolyte, the streaming potential.

Is a freestanding hybrid film suitable for solar power generation?

Solar energy fits well with the increasing demand for clean sustainable energy. This paper describes a freestanding hybrid film composed of a conductive metal-organic framework layered on cellulose nanofibres which enables efficient solar power generation.

What is a solar film?

Unlike conventional solar panels, solar films offer a level of flexibility and adaptability that was previously unattainable, marking a significant leap in solar technology. Heliatek, a German brand established in 2017, introduced HeliaSol, an ultra-thin, flexible solar film resembling a sticker.

What materials are used for thin-film solar technology?

The most commonly used ones for thin-film solar technology are cadmium telluride (CdTe), copper indium gallium selenide (CIGS), amorphous silicon (a-

Si), and gallium arsenide (GaAs). The efficiency, weight, and other aspects may vary between materials, but the generation process is the same.

Can thin-film solar cells absorb light?

The ability of thin-film solar cells to absorb light can generally be increased using light-scattering structures, which, however, are difficult to create on flexible substrates.

Are Solar Films a viable alternative to traditional solar panels?

The quest for renewable energy has led to the emergence of solar films as a promising alternative to traditional solar panels. This innovation is rapidly gaining traction in Europe, with companies like Heliatek (Germany) and Solar Cloth (France) at the forefront.

What is the future of Solar Films?

The future of solar films also includes further advancements in glass integration. With millions of window units installed globally each year, the opportunity for incorporating solar films into glass products is vast. This integration not only generates electricity but also reduces heat build-up in buildings, offering a multifunctional solution.
