The standing fan under consideration is an axial type meant to be powered with a DC source from a solar panel with a 12V battery backup. A typical fan system consists of a fan, an electric motor, a drive system, duct or piping and flow control devices (Department of Energy Efficiency and Renewable Energy, 2003).

In this research a 3-blade standing fan of 30 watts capacity capable of providing 6 hours of continuous operation was powered with just 1 photovoltaic (PV) module of 80 watts power rating.

To tackle this issue this project proposes the design of a cost effective self-powered solar fan whose cost of production is affordable in respect to similar products currently in the market. The current market lacks a low-cost solar fan with energy storage, an essential feature for allowing operation of the fan when there lacks direct sunlight.

With the "Green Science Fair" contest running on Instructables we decided upon making a solar powered fan out of it. It's really pretty basic. We took a battery holder (2 AA batteries) and wired it into a 1.5V to 12V step up circuit. Now that we had it outputting 12V we hooked it into the fan.
