In particular, hybrids of geothermal and solar power systems (e.g. photovoltaic and concentrated solar power) have been shown to be mutually beneficial and a promising combination of renewable energy sources.

Geothermal, solar and wind are all clean, renewable energies with a huge amount of resources and a great potential of electricity generation. Geothermal energy had definitely dominated the renewable energy market in terms of the installed electricity power about 30 years ago.

This paper summarizes the geothermal power generation technology in recent years, including geothermal steam power generation, flash technology power generation, ORC power generation, Kalina power generation, dry hot rock power generation and geothermal generation coupled with solar energy and water power generation.

In this paper, an ORC power generation system model coupling solar energy and geothermal energy is established for the air cooling power station with drought and water shortage, geothermal energy and solar energy rich areas.

In this work, a hybrid system consisting of a single flash steam geothermal power plant and a solar thermal system using a parabolic trough collector (PTC) is studied. Based on the available works in literature, the required design materials and modeling equations are chosen and discussed.
