Two common interconnection methods are substation interconnection and line tapping:Substation interconnection: For this method, the solar farm sends electricity through a generation intertie (gen-tie) line to a new or existing substation. Line tapping: Line tapping bypasses the substation, instead establishing the POI on a transmission line. .

Solar farms connect to the grid by converting the direct current (DC) generated by solar panels into alternating current (AC) through inverters.

Unless the solar farm is right next to a transmission line or substation, a dedicated transmission line called a generation tie (“gen-tie”) will need to be built.
